Diagrams at right show the
structure of the 24
Latin squares below. Each
two-color diagram has 3 parts
that show the locations of the 6
element subsets of {1, 2, 3, 4}.

At left are the 12 Latin squares, with first row in standard 1234 order, that are structurally distinct modulo the group of 8 symmetries of the square.

Each Latin square can be converted to a graphic figure by mapping the digits 1234 to the four triangular half-squares in some order. (This can be done in 24 ways; one of the ways is shown at left.)

Such diagrams were devised to prove the diamond theorem of Steven H. Cullinane. See diamondtheorem.com and finitegeometry.org/sc for details.

The image above shows all such graphic figures that are structurally distinct modulo the group of four rotations of the square in the square's own plane.
